ROYAL LIVERPOOL UNIVERSITY HOSPITAL

CONTINUATION SHEET

SURNAME Mr Mrs Miss	INITIALS	SEX	AGE	WARD	CONSULTANT	UNIT No.

DATE

21 June 1993

William Murphy
Diagnosis - Severe Haemophilia
HIV sero negative
Cirrhosis of the liver

Bill seems very well. He is due for some more scherotherapy, or at least an endoscopic review next month. His varicose leg ulcer on the right leg has also more or less healed. He has had few bleeds, and is not using much Factor VIII. On examination he has fairly severe limitation of pronation and supination in both elbows. He has normal range of movement in his right knee, and there is a good range of movement in the left knee, and it bends to about 75°. He has no problems in his hips and shoulders. He is clearly not doing his quadriceps exercises or indeed any exercise of any sort, and there is very marked wasting of his left quadriceps. I have encouraged him to exercise to a greater extent and specifically to do quadriceps exercises 3 or 4 times a day.

We will review him in 3 weeks or sooner should there be any problems.
