Koate® sales (in AHF units) in the period January through April 1983 were down 291 when compared with the same period in 1982. To determine why sales were down so sharply, parameters of the entire customer base during these two time periods were compared to identify general trends. The top 45 accounts of early 1982 were analyzed individually to identify specific reasons for sales decline (when present).

Star and Live of Cin

Concern about transmission of Acquired Immune Deficiency Syndrome (AIDS) has definitely caused shrinkage of the market for factor VIII among Cutter customers. Most institutions appear to be following the National Hemophilia Foundation's recommendations and thus have switched some patients to cryoprecipitate and are delaying elective surgery when appropriate. Additionally some centers feel some of their patients may be reducing dosage or using concentrate less frequently than in the past - even though in most cases physicians have not recommended any change in treatment.

However, sales loss may not be attributable solely to AIDS. For instance, there were 13% net fewer accounts in early 1983 than in early 1982. The biggest net loss of accounts (and sales) was in the hospital customer segment. Unfortunately it is not possible to isolate the sales impact of this general decline from other factors.

Two additional factors contributing to the sales decline are probably being helped by concern about AINS, but the sales decline are probably being The American Red Cross appears to be taking advantage of the AIDS crisis to increase market share with its purportedly "cleaner" (volunteer) blood in certain areas, although its political savvy is also playing a part in their growth. Hyland may be finding it easier to convert accounts to their new heat treated product due to fear of AIDS, but some accounts consider the theoretical reduced risk of hepatitis to be sufficient reason to switch, especially for new patients.

Part 2, the Physician Teleconferences on AIDS' Impact (to be published late in July), reveals a great deal about physician attitudes toward donor pool importance and the relevance of heat-treated product and is a much better predictor of the future than this descriptive report.

II. CONCLUSIONS

-

-

............

•

o Factor VIII usage among Cutter customers has clearly decreased due to concern about transmission of AIDS and resultant changes in treatment. However, the Red Cross also appears to be increasing its market share among Cutter customers since it uses only volunteer donors (presumably "safer" with regard to AIDS) and it also puts key clinicians on their board and thus encourages switching to Red Cross concentrate. Heattreated product is also contributing to reduced Koate<sup>®</sup> sales, although it had affected only one large account as of April 1983. (It just became available for sale March 21, 1983.)

-2-

- 20-

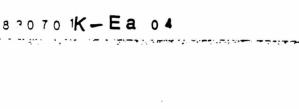

DEFER

··· · •

-...

· .....

- o The net number of Cutter Koate<sup>®</sup> accounts has declined from 403 in early 1982 to 350 in early 1983, a 13% decrease. Since five distributors have been dropped since early 1982, one would have expected the number of accounts to increase. In absolute numbers, the most accounts were lost in the hospital segment. Impact of this net account loss versus other factors cannot be estimated however.
- o Customer Service Records (CSRs) indicate that solubility (reconstitution time) is a continuing problem with Koate<sup>®</sup> and more recently the yellow color of Koate<sup>®</sup> has caused complaints. However, it is not clear whether this has resulted in any sales loss, especially when compared with the importance of pricing.
- o Orthopedic Hospital represents a unique problem in that some portion of a very large sales decline (-2.3 million AHF units) is due to disagreement over KoateD assay results. No specific product problem is evident, yet there has been significant account market share impact (per Sales).

# III. RECOMENDATIONS

• AIDS Surveillance: Continue to monitor developments in the spread of AIDS. Further incidence among hemophiliacs could cause even more downturn in KoateD usage and Cutter could quickly develop a massive excess inventory situation.

. . .

-3-

- <u>Competitive Surveillance</u>: During this volatile period it is especially important to continue aggressive investigation of competitive activity with regard to pricing, product quality and product service. AIDS may be causing some accounts to re-evaluate the value of Red Cross sourced (volunteer donor) and heat-treated alternatives.
- <u>Heat-treated</u>: Continue development of heat-treated product since some accounts are switching, despite higher price and total lack of clinical data. Due to AIDS, this has become an emotional issue. More discussion of this issue will be presented in Part 2 - Physician Teleconferences on AIDS' Impact.
- <u>Product Quality</u>: Manufacturing should continue to strive toward a clear and colorless, fibril-free, fast reconstituting product so business is not lost in the future due to <u>patient</u> dissatisfaction with Koate®.

# IV. PURPOSE

This study was designed to determine reasons for the Koate® sales decline in early 1983. Specifically, how have the following factors affected Cutter accounts:

-4-

 AIDS - How has concern about transmission through blood products affected concentrate usage?

- · Heat-treated product Have customers switched?
- Product characteristics Are there problems causing dissatisfaction?
  Pricing Has Cutter lost a great deal of business due to (high) bids?

This portion of Marketing Research Project #623 is intended to be descriptive whereas Part 2 has much better predictive value since it investigates the attitudes and thought processes of physicians.

# V. INTRODUCTION

Koate® sales in AHF units for the four month period January through April 1983 were 29% lower than during the same months in 1982, a decline of over 20 MM AHF units. It was clear that concern about AIDS prevention was affecting usage, but the extent of this effect was unknown. It was also possible that other factors could be contributing to a loss of market share, not just decrease in the total market size.

January 14, 1983 the National Hemophilia Foundation (NHF) gave recommendations for preventing AINS in patients with hemophilia. Please see Appendix A for the complete text. In surnary, the Medical and Scientific Advisory Council recommended that the following patients be put on (or kept on) cryoprecipitate: a) newborn infants and children under 4. b) newly identified patients and c) clinically mild hemophiliacs. Elective surgical procedures are to be evaluated carefully and possibly delayed. A synthetic antidiuretic hormone, 1-deamino-8-d-arginine vasopressin (DDAVP), should be used for some mild and moderate patients.

# VI. RESEARCH VETHOD

Year-to-date Koate® Sales report (BKDSLL.941 showed 1982 and 1983 January through April sales of Koate® for involced customer accounts. (Note: Not all shipping locations were included.) Different account numbers for some institutions and multiple locations for the same account number were combined when discovered. (There is chance for some error in this manual combination process due to the way account names and numbers are assigned.)

The total number of accounts were tallied and then manually split into seven customer-type segments: Hospitals, Blood Banks, Military, Pharmacies, Distributors, Hemophilia Foundations (without specified hospital affiliation) and Other.

The 45 accounts which purchased more than 400,000 AHF units in 1982 were analyzed individually. If sales were down, Biological Sales personnel (Headquarters, Field Sales Managers and, in some cases, Sales Representatives) were contacted to discuss the reasons. Documentation in Bids and Quotation's file was analyzed for information about "lost bid" accounts.

Due to concern about customer discomfort with direct questions on Koate® usage and duplication with Part 2 of this research project, customers were contacted as little as possible. Thus much of the information in this report comes from indirect sources. In this researcher's opinion, it is more likely that errors of omission have occurred than commission (bias, distortion).

When it was necessary to interview customers by phone, the nurse coordinator was usually surveyed since <u>sary</u> doctors were contacted regarding participation in Part 2 of this project. Additionally it was felt that in some instances the nurse coordinators might actually have more insight on patient attitudes and current factor VIII usage. See Appendix B for the discussion guide/questionnaire.

# VII. FINDINGS

aga na •a,

·\* .,

There was a 13% net reduction in the number of customer accounts: unfortunately, it is not possible to cuantify the relative sales impact of this net loss versus other factors for the following reasons:

- Because many accounts buy from more than one supplier, a reduction in purchases does not necessarily reflect reduction in usage.
- Reduction in purchases could result from AIDS concern, product quality issues, availability, etc. There is no quantitative way to isolate these problems when they are combined in one account.

See Tables 1, 2 and 3 (bages 9 -10) for a summary of changes in Koate? accounts between early 1982 and 1983 by customer segments. Highlights follow:

- The hospital segment lest the most accounts (-4" net) and had the biggest decline in units purchased (-13.4 million AHF units net). (Tables 1 and 2).
- Aside from distributors, the military segment had the greatest percent decline in number of accounts (-42% net). (Table 1).

 Beside distributors, blood banks had the greatest percent decrease in the number of AHF units purchased (-38% net). (Table 2).

-6-

•\_\_\_

A STATE OF

 Blood banks represent a high percent of sales relative to the number of accounts. (Table 3).

Table 4 (pages 11-15) details the purchasing situation in the top 45 accounts (ranked by January through April 1982 sales.) Table 5 (page 16), shows new "large" (greater than 400,000 AHF units purchased in four months) accounts as of April 1983.

It is important to remember that, in the opinion of several sales managers, <u>a 10 to 201 variance</u> in a four month time period is normal due to different amounts of emergency surgery, inventory level changes, etc. Also keep in mind that many accounts use multiple vendors and the percent change in Cutter sales does not necessarily reflect what the account as a whole is doing. For instance, one hospital showed a 10% sales increase to Cutter but in the teleconference (Part 2) the Medical Director said his records showed a 15% decrease in factor VIII usage. Another limitation to the data is that Table 4 reflects invoiced units, not actual usage, although one should follow the other relatively closely except in times of inventory build up or reduction.

• AIDS impact:

- Elective surgery is being postponed in some institutions (See Part 2 for physicians's attitudes about this).
- Some patients are asking to be switched to cryoprecipitate and some physicians are using cryoprecipitate for surgery now when previously they used concentrate.
- Physicians are following NHF recommendations on use of cryoprecipitate with young and mild patients.
- Some patients are cutting back on dosage and number of uses -especially if they were treating heavily (possibly "over-treating") before. Only a few centers had recommended this reduction however.
- Two centers recommended against using concentrate prophylactically or recommended cutting back on prophylactic usage.
- Orthopedic Hospital in L.A., the single largest account, reduced purchases by Z.5 million AHF units (-45%) reportedly due to some extent on Koate® not passing their assay test (in addition to complete halt of their extremely heavy elective surgery schedule for several months).

A DESCRIPTION OF A DESCRIPTION

·...

;

The state of the s

1

:

:

----

. Pricing on contracts caused a net loss of 2.1 million AHF units among large accounts. Seven accounts were lost (exclusive of distributors) and four new ones were added in early 1983. Three more accounts increased purchases to the "large" account status in 1983 (Tables 4 and 5).

. Three accounts have partially switched to Red Cross concentrate due to: (Table 4)

-7-

- Feeling that the risk of AIDS is less with volunteer donor fractionated plasma.
- Political considerations (Luminary physicians are put on the Red Cross Board and thus are encouraged to buy Red Cross products.)
- Significantly lower price of 8.5¢/AHF unit (in one account).
  - Note: These accounts would switch entirely to Red Cross product if the supply becomes/stays adequate (per Sales). One district sales manager felt the Red Cross was pursuing new business very aggressively and could be expected to expand production capacity long term.
- One account has partially switched to heat-treated factor VIII. Two more feel they will be switching (Table 4).
- Sales representatives for two accounts mentioned that they sent in Customer Service Reports (CSRs) on Koate® not re-constituting properly (Table 4).

### • General observations: (Table 4)

ارز ایند. به استیکیه دیکیه ۲۰۰ میرود به دیکی میرونی در این این میرود دیکیه در این این این میرونی دیکیه دیکیه دیکیه دیکیه

×.

### - 5 of the 45 top accounts were distributors

- Blood banks are a high proportion of the large accounts (22%) versus just 7% of the total number of accounts.

The comments about large accounts on Table 4 help to explain about twothirds of the total unit sales decrease. (See Table 6, page 17 for the calculation.) Please keep in mind that even among the top 45 customers there could be additional factors causing the sales downturn which were not discovered due to the way information was collected, i.e., primarily indirectly.

Table 7, page 18, shows the major non-human product problems with Koate® from January 1982 through March 1983 as reflected on CSRs. Although the number of CSRs is small relative to the number of KoateD customers, it does appear that solubility and perhaps the yellow color are continuing problems. Appendix C, a portion of a letter from a customer also succinctly

4

105

26

-

1

highlights some product deficiencies relative to competitors. One can probably assume that Table 7 and Appendix C represent only a portion of the real problem since it is human nature to delay writing manufacturers about dissatisfaction.

-8-

It is completely unknown at this point how a center would weigh product cost against patient satisfaction with the product from a convenience/ aesthetic standpoint (as opposed to medical effectiveness).

		APPENDIX A Page 19
		Recommendations of
		ine Medical and Scientifie
		Advisory Council submitted to the NHF board of Directors
(		HEMOPHILIA FOUNDATION
ļ		•
		THE NATIONAL HEMOPHILIA FOUNDATION
		MEDICAL AND SCIENTIFIC ADVISORY COUNCIL
		January 14, 1983
		RECOMMENDATIONS TO PREVENT AIDS IN PATIENTS WITH HEMOPHILIA
L	Re	ecommendations for physicians treating patients with hemophilia.
	۸.	. It is recommended that aryoprecipitate be used to treat patients in the following groups except when there is an overriding medical indication:
		- newborn infents and children under 4
		- newly identified nationts never treated with a
		Similar guidelines should be explied to former the infrequent treatment.
	в.	
	2.	The potential advantages and assadvantages of cryoprecipitate versus factor VIII concentrate therapy for severe hemophilia A are not clear at the present time and are controversial. The Medical and Scientific Advisory Council does not offer a specific recommendation at this time, but will continue to review the data.
	c.	DDAVP should be used whenever possible in patients with mild or moderate hemophilia A.
	D.	All elective surgical procedures should be evaluated with respect to the possible advantages of a delay.
Π.	Rec	commendations to factor VIII concentrate manufacturers:
	۸.	Serious efforts should be made to exclude donors that might transmit AIDS. These should include:
		<ol> <li>Identification, by direct questioning, individuals who belong to groups at high risk of transmitting AIDS, specifically male homosexuals; intravenous drug seers; and those who have recently resided in Haiti.</li> </ol>
		<ol> <li>Evaluation and implementation (if verified) of surrogate laboratory tests that would identify individuals at high risk of AIDS transmission.</li> </ol>
		3. In addition, the manufacturers should crease using plasma obtained from donor centers that draw from population groups in which there is a significant AIDS incidence. It is clear from the epidemiologic data that the pool of individuals at risk for AIDS transmission is not uniform throughout the country and that a great deal could be achieved by excluding donors from the bount of the should be achieved by excluding donors form throughout the country and that a great deal could be achieved by excluding donors form throughout the country and that a great deal could be achieved by excluding donors form throughout the country and that a great deal could be achieved by excluding donors form throughout the country and that a great deal could be achieved by excluding donors form throughout the country and that a great deal could be achieved by excluding donors form throughout the country and that a great deal could be achieved by excluding donors form throughout the country and
	B	Efforts should be continued to expedite the development of processing methods that will inactivate viruses potentially present in factor VIII concentrates.

APPENDIX C

June 13, 1983

Page 24

Jan Peterson Product Marketing Hanager Cutter Biological 2200 Powell Emeryville, CA 94608

# Dear Ms. Peterson,

As the mother of a hemophiliac who has been using various brands of Factor VIII for the past 12 years, I thought you may be interested in some feedback on how Koate compares to other brands from the user's point-of-view.

My first concern is that Koate is not vacuum packed, although I hear that that process is now changing. Transfering the sterile water to the concentrate is much easier when using a transfer needle in vacuum jars. So easy, in fact, that my son does it himself with Profilate (Alpha), but cannot with Koate.

Why does it take so long for Koate to mix? The particles are so large and clumped together that it takes at least five minutes of stirring, even when both water and factor were warmed. As I'm rushing to get the injection done and get to work on time, those minutes mean a lot. Profilate takes about 1 - 1 minutes.

Another issue is your filter needle. It is old technology that I've seen ten years ago. Check out some of the new plastic disc filters. The factor goes into the syringe with very few bubbles.

The last issue, which you're very aware of, is the color. I'm not sure of its real effect, but psychologically it looks dirty or polluted.

May I take this opportunity to sincerely thank Cutter for the money and effort expended for Northern California Hemophilia Summer Camp. My son enjoys it, I need the break, and this year it is especially appreciated as Ian will learn to infuse himself at camp. Bravo.
