Hepatitis Free Factor VIII - Ohren

H-8.274

December 8, 1978

This I am not ready to believe. It would require a method of identifying and removing all hepatitis viruses including the so-called non A, Non B. This is not possible. Even the 10 hours at 60°C used for inactivating virus in albumin products cannot be used on AHV. I can't imagine what Ohren has heard and I intend to ask him for more information.

Cutter has nothing or even prospects on this.
