HOW WE USE YOUR INFORMATION	

Under the Data Protection Act 1998, we have a duty to protect personal health information. This information is securely held, closely monitored and managed according to strict guidelines. Access to personal information is only given on a strict need to know basis and there are formal authorisation processes in place to gain access to the data.

We only collect essential personal information required to process applications and make payments under the Scottish Infected Blood Support Scheme. This includes:

- a) Your demographic information, marital status, National Insurance number and CHI number (this is a national database of all patients with NHSScotland, which ensures correct identification of patients).
- b) Details of your healthcare providers and the care you have received.
- c) Bank account details.

SECTION 1(C) ADDITIONAL INFORMATION

Once you have completed all parts of Section 1, please pass the form to a medical professiona to complete.

The medical professional will complete the remainder of the form and return it directly to the Scottish Infected Blood Support Scheme on your behalf.

FORM E V1.0

Scottish Infected Blood Support Scheme

Page 3 of 15

THE FOLLOWING SECTIONS MUST BE COMPLETED BY A MEDICAL PROFESSIONAL

GUIDANCE NOTES FOR MEDICAL PROFESSIONALS

Thank you for your help with this application. In most cases this form will concern a patient who is known to you and who has been infected with Hepatitis C.

This form is for applicants who are receiving chronic Hepatitis C payments from the Scottish Infected Blood Support Scheme, who now wish to apply for advanced Hepatitis C payments.

To be eligible to receive these payments, the applicant must have had a chronic Hepatitis C infection and have developed either:

- Cirrhosis
- Primary liver cancer
- B-cell non-Hodgkin's lymphoma; or
- Has received a liver transplant, or is on the waiting list to receive one

If the applicant's circumstances meet the above criteria, you should complete Sections 2-8 of this form, only if you are the consultant physician currently in charge of the applicant's care.

It is intended that the existence of cirrhosis should be assessed using either existing biopsy data, or the results of non-invasive tests. A liver biopsy should not be performed purely for the purpose of making this application.

When complete, please return this form along with all relevant documents direct to the following address:

Scottish Infected Blood Support Scheme Practitioner Services Gyle Square 1 South Gyle Crescent Edinburgh EH12 9EB

ADDITIONAL NOTES ON THE LAYOUT AND COMPLETION OF SECTION 2-8

Section 3	This section asks whether the applicant has undergone liver transplantation, is currently awaiting a transplant, or has developed primary liver cancer.
1	If any of these circumstances pertain, Sections 4-8 do not need to be completed.
Section 4	This section seeks information of liver histology, where available.
	Where histological proof of cirrhosis is available, Sections 3 and 5-8 do not need to be completed.
Section 5	This section asks whether the applicant has developed B-cell non-Hodgkin's
	lymphoma.
	If this is the case, Sections 3-4 and 6-8 do not need to be completed.
Section 6	This section should be completed for applicants for whom a liver biopsy has never
	been performed, or without recent liver histology. It asks for the calculation of two
-	simple indices, based upon readily available laboratory tests, which have been used to
	predict cirrhosis. The chosen indices require recent and repeatable measurements
	(two samples not less than three months apart) of the two liver enzymes, aspartate
	aminotransferase (AST) and alanine aminotransferase (ALT), and the platelet count.
	Further details of these indices are shown on the next page.
	A DDI S O O to gother with on
	With regards to the payment for Advanced Hepatitis C, an APRI ≥ 2.0 together with an
	AST/ALT ≥ 1.0 will be accepted as presumptive evidence for cirrhosis provided there
	are no factors other than fibrosis which are potentially affecting the AST, ALT and
	platelet readings. Where both these indices are at or above these cut-offs, and there
	are no other factors other than fibrosis which may be affecting the AST, ALT and
0 11 7	platelet readings, then Sections 7-8 do not need to be completed.
Section 7	This section should be completed for an applicant whose application depends on establishing a diagnosis of cirrhosis and for whom a liver biopsy has not been
1	
A STATE OF THE STA	performed (or has not been performed recently), and where the simple indices used in Section 6 do not predict cirrhosis, or there are other factors other than fibrosis
	influencing these readings. The purpose of this section is to record any other
	information already available that may assist the Scheme in determining whether
	cirrhosis is probable. This may include transient elastography (e.g. FibroScan®)
	results.
Section 8	This section must be completed in respect of an applicant who is relying upon
	information supplied in Section 7 to support the application. It seeks an overall clinical
	opinion as to whether or not cirrhosis is probable.

INDICES

i. Aspartate aminotransferase to platelet ratio index (APRI)†

This index has been developed to amplify the opposing effects of liver fibrosis on the level of aspartate aminotransferase and the platelet count.

$$APRI = \frac{(AST/ULN) \times 100}{Platelets(10^9)/L}$$

where AST is in IU/L and ULN is in the upper limit of normal

For example, where a patient has a platelet count of 120 x 10^9 and an AST level of 90 (ULN = 45), the APRI is calculated as:

$$APRI = \frac{(90/45) \times 100}{120} = \frac{2 \times 100}{120} = 1.67$$

†Wai C-T, Greenson JK, Fontana RJ, Lalbfleisch JD, Marrero JA, Conjeevaram HS, Lok AS-F. A simple noninvasive index can predict both significant fibrosis and cirrhosis with chronic hepatitis C. *Hepatology* 2003; **38**: 518-526

ii. Aspartate aminotransferase-alanine aminotransferase (AST/ALT) ration index ‡

This index is based upon the observation that, as chronic liver disease progresses, AST levels increase more than ALT levels.

$$Ratio = \frac{AST}{ALT}$$
 where AST and ALT are measured in IU/L

‡Giannini E, Risso D, Botta F, Choarbonello B *et al.* Validity and clinical utility of the aspartate aminotransferase-alanine aminotransferase ratio in assessing disease severity and prognosis in patients with hepatitis C virus related to chronic liver disease. *Arch Intern Med.* 2003; **163**(2): 218-24

SECTION 6 SIMPLE INDICES PREDICTIVE CIRRHOSIS

This section is to be completed for an applicant for whom a liver biopsy has not been performed, or without recent liver histology. The chosen indices require recent and repeatable measurements (two samples not less than three months apart) of the two liver enzymes, aspartate aminotransferase (AST) and alanine aminotransferase (ALT), and also the platelet count.

(Note: if there are factors which could potentially affect the AST, ALT or platelet levels in this applicant, other than fibrosis, please indicate what these might be in Section 7. If the influencing factor is more recent, for instance because the applicant is/was undergoing antiviral therapy, then please either use blood results taken before or after the course of treatment and/or complete Sections 7 and 8).

	First Test Result	Second Test Result	Upper Limit of Normal (ULN)
Date Test Performed	06.10.16	17.01.17	
AST (IU/L)	21		(45)
ALT (IU/L) Platelets x 10 ⁹ /L	(93	193	(450)

CALCULATED INDICES

3, 12902 (, 22), 12722	First Measurement	Second Measurement
APRI	0.24	9.196
AST/ALT Ratio	« (.c ₄	1.8

For further guidance on these indices, see page 6 of this form. With regards to the payment for Advanced Hepatitis C, an APRI ≥ 2.0 together with an AST/ALT ≥ 1.0 will be accepted as presumptive evidence for cirrhosis.

If both of these indices are at or above the specified cut-off values, there is no need to complete Sections 7-8.

If these indices give discordant results, or both are below the specified cut-off values, please complete Sections 7 and 8.

FORM E V1.0

Scottish Infected Blood Support Scheme

age 14 of 15

XSB 00/32

RICHARDS, Sally (NHS NATIONAL SERVICES SCOTLAND)

From:

Sent: To:

KICHARDS, Laily (NHS NATIONAL SERVICES SCOTLAND)

Subject: RE: Scottish Infected Blood Support

Oliminal Advice

Dear Ms Richards

I have had an opportunity to look through the two cases and will summarise my thoughts below:

Case 1

XSB 00132

There is nothing here which strongly supports cirrhosis. There was no liver biopsy. The APRI ratio is less than 1 and although the AST to ALT ratio is over 1, ALT and AST are normal. The albumin is 44. Clinical examination was normal. An ultrasound scan shows a bright liver and normal spleen in the scan of 10.2.17 and an MRI scan showed diffuse fatty infiltration with a spleen at the upper limit of normal. A fibroscan on 10.2.17 showed a liver stiffness of 8.8 kPa which would represent only mild fibrosis. The liver stiffness on 11.7.16 showed a value of 14.4 kPa with an IQR of 4.9 making that scan result unreliable. I think overall here there is nothing to support cirrhosis. I would be interested to know whether he had treatment for his hepatitis C between the two fibroscan tests.

Case 2

I am afraid here also there is nothing to support cirrhosis. He died at the age of 17 from AIDs along with hepatitis C co-infection. There was no liver biopsy. AST to ALT ratio is over 1. His ALT is within the normal range. His APRI was normal. An ultrasound scan in April 1992 showed no significant abnormality and obviously a fibroscan was not available in 1992. I think on balance it is unlikely this man had cirrhosis.

I hope this information is of some help.

Kind regards Yours sincerely

Royal Infirmary of Edinburgh

I have been asked to send document self rather than his university email address which is not secure for sending confidential medical dreamable us to decide whether or not there is significant evidence to support the claim that the applicant has/had cirrhosis. Would you mind printing off these documents and passing them to Professor Hayes?

Case 1 – We are looking for confirmation that the results from the Fibroscan confirm the probability of cirrhosis?

Case 2 – The patient is deceased – does the medical evidence available support the probability of cirrhosis? For further information on the Scottish Infected Blood Support Scheme – see our website – www.nhsnss.org/SIBSS Thank you for your assistance in this matter.
