- Title of Project: National registry of transfusion acquired hepatitis C (HCV) infections and of other infections of a known date of acquisition
- 4. Abstract of Research: No more than 200 words covering the following topics: aims of project; research subject group; sample size, type and location: methods of working.

The registry of "known date" hepatitis C (HCV) infections will aim to monitor the natural history of HCV infection.

Infections acquired through transfusion of blood or blood products (primarily those identified through the current "lookback" exercise) will form the nucleus of the register. It will be extended to include other types of "known date" HCV infections.

A registry coordinator will invite clinicians responsible for the continuing care of infected individuals to register them. Follow up information will be collected annually.

The registry will provide regular and continually updated estimates of the distribution of times from infection to biochemical, histological and clinical HCV-related illness and death, and will be a resource to be used for future studies.

The register of infections acquired through transfusion will be administered by the NBS (through the NBA) and PHLS CDSC, in collaboration with blood centres, hepatologists and others responsible for the care of HCV-infected patients.

Funding for an initial period of three years will be necessary to establish the registry, to pilot recruitment, explore the problems of ascertainment biases, pilot the use of data and monitor the early outcomes of HCV infection. To reap full benefit, long term support will be required.

Zene.	Folicy Relevance of the Research:	
and fa	arer understanding of the natural history of HCV intect actors which may increase or reduce these is vitally resemble the impact—which HCV infection may be mining the future allocation of resources.
