Mr. J.D. Peach,

GRO-C

Northants

Dear Mr. Peach,

Thank you for your letter. The results of tests on Jason show that he is HTLVIII antibody positive which means that he has at some time been in contact with the virus and has made antibodies to it. It does not mean that he has AIDS or is going to get it. The vast majority of people who are antibody positive are in good health and remain in good health. Only a very small number have any health problems. I suggest that you come to the Centre with or without Jason to discuss in more detail what this all means.

Yours sincerely,

C.R. Rizza
Consultant Physician
