Dear Dr Kinnis

Re: Jonathon Evans dob GRO-A/62

GRO-A

Jonathon Evans was discharged today from the Muffield Orthopaedic Centre, having been admitted on Wednesday 22 May 1991 with a bleed in his left knee. The pain and swelling has settled with rest in a backslab and treatment with Factor VIII.

We have taken the opportunity to review this patient's general condition. His CD4 lymphocyte count continues to drift slowly downwards and the current value is $0.09 \times 10^9/L$ (normal range $0.4-1 \times 10^9/L$). Since the count is now below $0.2 \times 10^9/L$, we have decided to start treatment with co-trimoxazole two tablets daily as prophylaxis against *Pneumocystis carinii* pneumonia. This treatment will be permanent. Unfortunately, our pharmacy will only provide a seven day supply and I would be most grateful if you could supply the patient with a large quantity. I have therefore requested the patient to contact you about this. I have told the patient that some patients develop a skin rash with this medication: if this does occur, I have told him to stop taking the medication and to contact us.

Dear Chris

RE: **Jonathon EVANS** d.o.b. **GRO-A/62**

GRO-A

Following Jonathon's recent visit to our combined clinic on John Warin Ward, I have received details of his full blood count which were as follows: haemoglobin 9.7 g/dl, WBC $0.9 \times 10^9/L$, platelets $52 \times 10^9/L$. There has been a gradual decrease in the white count over the last few months, which is likely to be due to his co-trimoxazole (septrin) therapy. I have written to Jonathon asking him to stop taking co-trimoxazole until we see him in our next combined clinic.

Yours sincerely

Dr. P.L.F. Giangrande BSc MD MRCP MRCPATH
