

Provisional HIV seroconversion data for PwBD 1979-1988

This table has been created by the Inquiry team for the purposes of these presentations only. Data pertaining to positive HIV test results has been extracted from *provisional* data provided by the UKHCDO to the Inquiry and is presented in a condensed form below. The UKHCDO has not approved, produced, sanctioned or checked it for accuracy. All data, including the inclusions, exclusions and results may be subject to change.

Inclusions

- A total of 5,567 PwBD with documentation of results for an HIV test on NHD were identified for this analysis.
- Only positive HIV test results recorded between 1979 and 1988 are included in this table.
- Only centres for which data has been provided by the NHD to the Inquiry are included.
- Two PwBDs had no documentation of an HIV result on the database but were reported to have HIV clinically from 1984. For this analysis both PwBD are reported as HIV+ve from 1984 onwards.

Exclusions

- PwBD who have died secondary to AIDS in the absence of laboratory test confirming the presence of HIV infection are reported in mortality statistics and excluded from these results. These will be presented by the Inquiry at a later time.
- In some instances, records have been labelled as 'not yet tested'. These were excluded from the source data and are not included here.
- Negative HIV results have been excluded for the purposes of these presentations.

Limitations

- The date of the first positive HIV test, as recorded in the database, reflects information reported to NHD. The date documented in the NHD is not necessarily the date of the first positive result and as such reports as late as the early '90s are noted in the database. For new registrations where PwBD has acquired HIV infection overseas, NHD does not hold a record of the country where infection was possibly acquired. Haemophilia Centres typically held more data than the NHD in relation to HIV tests and where an infection may have been acquired, however that data may not be complete.

Results

- PwBD are included in the results only once per year, irrespective of the number of tests that year. Individuals reported as newly positive in the first year for which they have a reported positive test.
- For every calendar year, the results are provided for first positive results. The number of positive results are summed in the final column by centre and the final row shows total first positive results by year for the sum of all centres.
