14.1.77 - seen by Mr. Moynihan - Satisfactory to wear splint for one week after bleeds.

SPRING TERM 1977

14.1.77	Right elbow	240 units Hemofil HJ 271075
C 22.1.77	Right quads	6 Cryo

X-RAY REPORT 21.1.77 - CHEST: The heart and lungs appear normal. KNEES: Bilateral haemophilia arthropathies are demonstrated. The right knee is much more severely affected than the left. Typical erosion on the proximal portion of the articular surface of the patella is present. Both knees are distended as the result of haemarthroses and I think diffuse density particularly in the posterior side is consistent with haemosiderin deposition. A bleed into the left knee is much larger than that on the right, since the whole supra patella pouch is grossly distended. ELBOWS: These joints also show typical changes of haemophilic arthropathies. They are much less severely affected than the knees. Both radial heads are enlarged. The lateral view of the right elbow suggests that this radial head is, in fact, subluxated forwards to a mild degree from the capitellum. Early cystic changes are developing at the proximal end of each ulna - an extremely common sight for these regions. ANKLES: Irregularity of the superior articular margin of the talus with some narrowing of the joint space again reflects haemorrhagic episodes into this joint. The left ankle remains normal in appearance.
