R T WENSLEY  
Consultant Haematologist

Dear Dr Thakur

RE: Suresh VAGHELA DOB: GRO-C 62  
GRO-C

This patient with haemophilia A remains very well and is bleeding infrequently. His target joint remains his left knee. On this occasion he continues to have hepatic enlargement and his spleen and lymph nodes are not palpable. I will be referring him to my colleague Dr Warnes in connection with the chronic liver problem. He will probably participate in a study of Interferon that Dr Warnes is carrying out at present. I will review him again in a further six months time.
