Date 21/5/85

Dr/Mr. Prof. H. Thomas

Will you please see the above patient, and give your opinion regarding treatment/prognosis/diagnosis?

Clinical Notes and investigations: Miss O'Donnell is a carrier of mild haemophilia with a low level of factor VIII (VIII C: 33u/dl). She has had a number of problems requiring treatment with factor VIII. Hemorrhectomy in 1976 was covered with factor VIII concentrate preoperatively but she hemorrhaged 3 days later & required transfusion of 9 units of blood & factor VIII concentrate for 14 days afterwards. She felt ill for about one year afterwards but was not clinically jaundiced. In 1980 she received treatment for a bleeding disorder which in 1983 she developed Hepatitis B about 3 months after being treated with factor VIII before having her back manipulated in Turbridge Hills. She was followed up for about a year by her G.P. but LFT's remained mildly abnormal. She has been HbAg neg. (on testing here) since Feb. 1984. She has recently been admitted here for S.M.R. by Mr. Groves & was given conv. with packed treated factor VIII concentrate, AS7, on admission was 73iu & one week later 60iu.

Signed

She reports that she still has episodes of feeling

House Physician/Surgeon

"off colour" & occasionally appears to be slightly jaundiced. She is planning to marry late this year & hopes to have a family. She has discussed the inheritance of haemophilia & both she & her fiancé are only too well aware of the risks of bleeding & of treatment. They would also like to know whether factor VIII she would be at increased risk during pregnancy in view of her past history of hepatitis and the prognosis in general terms. I would be grateful if she could be given an appointment for genetic review & assessment & advice on prognosis & future management.

Elaine Goldstein (Clinical Assistant)

Will consultant, if he thinks fit, undertake the further care of this case?

Signed
