Dear Dr Lim

Re: Angus Horatio STEWART, d.o.b. **GRO-C** 1965
GRO-C Herts. **GRO-C**

This gentleman with type 2M von Willebrand Disease has been infected with chronic hepatitis C genotype 3A. He received treatment with Pegylated Interferon and fixed dose Ribavirin of 800mg daily from April 2006 – October 2006. Although he had an end of therapy response where the HCV PCR was undetectable he has relapsed 6 months after stopping therapy. Genotype 3A is notorious for having a high relapse rate. If we were to consider re-treatment for this gentleman using the same dosage of Interferon but Ribavirin on a weight-based dosing where he will be receiving Ribavirin in the dosage of 1000-1200mg daily for another 24 weeks. Would you be able to fund the re-treatment of this gentleman? I would appreciate if you could kindly reply to this?

Kind regards.

Yours sincerely

GRO-C

Dr. Thynn Thynn Yee
Associate Specialist
