Dear Dr. Jaswan,

Miss Maria Gavriel

I received the liver biopsy in good condition. The result is **35**  $\mu$ g iron per mg protein. Our normal range is up to 6 with a median value of 1 (Gastroenterology 79, 877-883, 1980).

It was necessary to homogenize the liver biopsy along with the liquid in the container. I think it is preferable to send the biopsy without liquid but frozen using the smallest possible tube. This avoids any problems of contamination from the solution.

I have assumed that this patient does not have infective hepatitis and is not positive for HTLV3. Would you please make sure that this is the case in future?

With best wishes,

Yours sincerely,

GRO-C

Mark Worwood
