Dear Dr. C B FERGUSON

RE: Edward Francis Conway, **GRO-C**
DOB: GRO-C, 1958

You may recall this 64 year old man who has Severe Haemophilia A, and who had Hepatitis C until it was treated successfully to March 2019.

My understanding from ECR is that a Fibroscan pre-treatment (November 2018) showed evidence of Cirrhosis, but that this appears well compensated at present. The last LFTs and AFP were carried out in June 2021 and were reassuringly normal. The last imaging on the system was January 2020, with a reassuring MRI scan – the other details for scans and clinics are noted below and on ECR.

I believe there was a plan to rebook an appointment for him and I wanted to highlight this following on from our difficulties to checking his LFTs recently.

Yours sincerely

Dr **GRO-D** **MB BCh, MRCP, FRCPath**
Consultant Haematologist
