OPERATION RECORD

Hospital No. **GRO-A**
 Surname **GRO-A**
 First Name **GRO-A**
 D. of B. **GRO-A 20**

M/F
 M/S/W

Surgeon **Dr Lewis**

Assistant **Dr Taylor**

Anaesthetist **Dr Howells**

Anaesthetic **GA**

Ward **Harvard**

Operation **Cholecystectomy**

Date **17.1.77**

Duration of operation **25**

Incisions **Kubler**

Findings
 Gallbladder fibrotic - flattened to liver and
 duodenum with adhesions.
 Cholangiogram: Post contrast - duodenum
 filled - no dilatation of hepatic ducts.
 no stones seen

PROCEDURE **Cholecystectomy with ligation of cystic
 duct and artery.**
 Gallbladder bed closed with H&I
 Redden Drain.

Other operations or investigations

HISTORY

Admitted for elective cholecystectomy. Over the previous year he had had episodes of upper abdominal pain which was colicky and followed by jaundice on one occasion in June, 1976. The pain was upper abdominal and radiated through to the back. A cholecystogram had shown gall stones.

PAST HISTORY

In 1963 laparotomy and appendicectomy following which he had been transfused 32 pints of blood.
In 1971 diagnosis of haemophilia made.
Over the last few years he had required cryoprecipitate, usually on three or four occasions per year, when he has a bleeding problem such as eg. recently haematuria.

EXAMINATION

Pleasant, slightly overweight man. Not jaundiced. Not anaemic.
Pulse 80. B.P. 140/80. Chest clear.

PROGRESS

After routine haematological work-up he was prepared for operation with full cryoprecipitate cover.

OPERATION

17.1.77. Cholecystectomy (Mr. Lewis assisted by Professor Kaplan)
The gall bladder was surrounded by adhesions. Operative cholangiogram showed normal diameter ducts with free flow into the duodenum and no stones. Routine cholecystectomy was performed. The gall bladder bed was closed with catgut and a haemostasis obtained. This operation was performed using the laser knife.

PROGRESS

He made an excellent recovery, complicated only by a slight serous discharge from the wound. However, he remained in hospital until all the discharge had ceased before being allowed home.

RF 603

Cont.

INVESTIGATIONS

Hb. post-operatively 12.9g

Blood urea 6.4

Chest X-ray - normal heart size, no recent lung lesion

HISTOLOGY

The gall bladder contains multiple small black faceted stones. The wall of the gall bladder shows chronic cholecystitis. The presence of lymphoid follicles in the gall bladder is sometimes associated "Salmonella typhi" carrier state. No evidence of malignancy.

Dr. K. Dormandy,
Haemophilia Centre,
Floor 1,
The Royal Free Hospital,
Pond Street.

Dear Dr. Dormandy,

re: Mr. GRO-A

GRO-A

We saw Mr. GRO-A in the clinic today following his
cholecystectomy. He is very well and symptom free and
no further appointment has been made to see him here.

Yours sincerely,

GRO-C

Adam Lewis, F.R.C.S.,
Consultant Surgeon.
