

Patient: Derek WHERRY (Mr) GRO-C - DOB: GRO-C 75

12.10.95

Combined Orthopaedic/Haemophilia Clinic - 12/10/95 Ribbans/Lee
Right Ankle: Mr Derek Wherry has had no improvement from physiotherapy. Still walking with quite marked inversion. He is locally and specifically tender along the lateral joint line, close to the anterior tibio-fibula syndesmosis. In view to his non-response to conservative treatment, I think he would benefit from a lateral longitudinal arthrotomy with a view to removing the quite marked anterior osteophyte. He lives with his girlfriend in Surrey and has problems with looking after dogs and cats. He is going to talk to Mrs Miller with a view to sorting this out.

Operation was due in February but as Mr Ribbans has now left the Royal Free, Mr Wherry will be re-assessed by Mr Goddard.

14.3.96

Combined Orthopaedic/Haemophilia Clinic - 14/3/96 Goddard/Lee
Mr Derek Wherry is quite happy with things at the moment and we have agreed to defer a decision for operation for the time being.

13.11.97

Combined Orthopaedic/Haemophilia Clinic - 13/11/97 Goddard/Lee
Three months ago Mr Derek Wherry had some problems with his Right Ankle in particular but everything has largely settled down. Objectively, he stands symmetrically, has some slight restriction of true ankle movement but the ankle itself is in good alignment. Subtalar joint is mobile and he can stand on tip toes without undue difficulty. Interestingly, despite his odd X-ray changes his footwear is normal. I think that he would be helped by some custom-built orthotics and have passed him on to Steve Kriss accordingly. Review SOS.

10.6.99

Combined Orthopaedic/Haemophilia Clinic - 10/6/99 Goddard/Lee
Mr Derek Wherry was involved in an RTA in April when he hit another car. As a result of this he sustained a minor whiplash injury, which is now resolving, although he does have some restriction of lateral flexion and rotation to the Right. In addition, he has some discomfort in the Right Shoulder which may well represent some stiffness as a result of a bleed - this too is slowly improving. There are no abnormal neurological symptoms or signs. Hips were largely unaffected. Knees sustained soft tissue injury but no haemarthrosis on the right. On the left, I suspect he may well have had a calf bleed, as he described swelling and bruising into the calf and the knee and, he still has a residual haematoma over the level of the tibial tuberosity. The Left Ankle had a brief exacerbation. Right Ankle is the worse affected - this of course was previously involved but has had increased bleeds and pain.

At this stage, since things are slowly improving, I would recommend some physiotherapy which he can have at the Royal Surrey County Hospital in Guildford
GRO-C His solicitors will be writing, probably for an report at some stage.

Dear Dr Thompson,

Combined Orthopaedic/Haemophilia Clinic - 23rd September 1999

Consultant: Mr Nicholas Goddard - Consultant Orthopaedic Surgeon
Professor Christine Lee - Consultant Haematologist

Patient: Derek WHERRY (Mr) DOB

Report:

Derek Wherry has had a further exacerbation of pain in his Right Ankle. Things are complicated by the fact that there is a court case pending, which may restrict his attendance at the clinics.

With regard to his ankle, I have put him back in touch with Steve Kriss. He missed an appointment there and I think he would do well for some orthotics; certainly in the short-term.

Yours sincerely

Dear Steve,

Patient: Derek WHERRY (Mr) GRO-C - DOB: GRO-C 75
GRO-C GRO-C

I think this chap missed some follow-ups to you a while ago.

I would be most grateful if you could see him and provide some orthotics and, perhaps, even get Michelle to give him an air-cast support for when things are bad.

Best wishes,

Yours sincerely

GRO-C
