

28.11.80 Treated today with Cryo X10 for epistaxis.  
 Developed a moderately severe transfusion  
 reaction — generalised erythema, urticaria  
 + rigor, which was abated with hydrocortisone  
 (Piriton had been given before infusion).  
 His future treatment should be changed  
 to NHS factor VIII concentrate — try  
 700u in first instance. Precede with  
 Piriton and obtain baseline LFTs + Hb<sub>s</sub> Ag  
 pre treatment. If concentrate is used,  
 weekly LFTs need to be obtained for  
 8 weeks after first infusion. Also consider  
 use of immunoglobulin — discuss with  
 Dr Keroff when need for treatment arises.
