DEPARTMENT OF HAEMATOLOGY

Professor Peter Kernoff  
Director, Haemophilia Centre  
Royal Free Hospital  
Pond Street  
LONDON NW3

29th December 1986

Dear Professor Kernoff,

re: 

GRO-B	dob	GRO-B
GRO-B		

 ESSEX.

This is the young lady whom I mentioned to you with Factor XI deficiency, whose most recent level was 3% as part of our study. She is now aged 26, and was diagnosed in 1981 following a total colectomy for ulcerative colitis when she needed 12 units of whole blood. Other than this, she had no previous history of bleeding and had had no surgery.

Since that time she has had some minor operative procedures, such as a D&C and EUA, for which she has received FFP and developed an allergy to it. Because of this, when she had a small naevus removed from her arm she was treated with Factor XI enriched Factor IX concentrate.

She has recently got married and wishes to start a family but wants some advice about risks involved with the pregnancy and so on and, of course, what treatment she should have should she require an operative delivery which is quite a possibility in view of her previous abdominal surgery and the fact that she has an ileostomy. I would be most grateful if you could see her and advise. I enclose a copy of her family tree. Her husband, 

GRO-B
-------

, has no family history of a bleeding disorder but we have taken a sample for Factor XI testing which I am forwarding to Angus under separate cover.

With best wishes.

Yours sincerely,

GRO-C

PAULA BOLTON-MAGGS  
SENIOR REGISTRAR IN HAEMATOLOGY

dictated by Dr Bolton-Maggs, signed in her absence.
