## HEPATITIS C TESTING

On the 1<sup>st</sup> of June 1992 the patient was seen by a Registrar, Paul Telfer while he was visiting his father. He was discussed about hepatitis C testing and the patient agreed to be tested, so virology was sent and the results from that testing, which was dated 2<sup>nd</sup> of June 1992 showed that hepatitis C antibodies by EIA was positive, hepatitis C antibodies by RIBA was indeterminate result. A second antibody testing was done on the 25<sup>th</sup> of November 1994 where hepatitis C antibodies by EIA was positive and the hepatitis C antibodies by RIBA was reactive. He had an in house HCV PCR done in the early 1990s by Paul Telfer and Helen Deverill and at that time the HCV RNA status was negative and this result is filed in the notes. His first exposure to concentrate was 5<sup>th</sup> of December 1981. He had a 3<sup>rd</sup> HCV antibody testing done on the 21<sup>st</sup> of November 2002 where the hepatitis C antibody was positive and HCV RIBA assay was also positive and the HCV RNA done on the 25<sup>th</sup> of November 2002 RNA was not detected.

As part of a study of natural clearer Mark Stewart stored samples one from the 2<sup>nd</sup> of June 1992 and the other from 25<sup>th</sup> of November 1994 were tested in October 1998. Those two samples were HCV PCR negative as well.
