Dear Dr Nelson

RECIPIENT OF DONOR UNIT G293740

I have now received all the results on the blood sample you sent from the above blood transfusion recipient. I can confirm that all tests are completely NEGATIVE (both by ourselves and by the Virus Reference Laboratory, Glasgow) thus indicating no evidence of sero-conversion to HIV. In view of the interval between transfusion and this blood sample it can be assumed that sero-conversion is now highly unlikely.

Yours sincerely

W M McCLELLAND

BELFAST

Dear *Moran*

re:

GRO-B

Herewith clotted blood sample from Mr GRO-B. GRO-B had a blood transfusion in July last year following a haematemesis and melaena. He has been on Zantac and has been quite well ever since. I called with him and said that one of the blood donors whose blood he got had developed a mild attack of hepatitis some weeks after the donation and that we wanted to check on GRO-B's blood. You will remember the number of the relevant bag - G293740.

I would be grateful to receive the results of your tests in due course.

Kind regards.

Yours sincerely

GRO-C
