ELECTIVE ADMISSION FOR			
ENDOSCOPY AND LAPAROSCOPY			
External cause of injury			
PM / no PM	Tumour Type	Histological Verification of Tumour	
		Verified/not Verified	

Dear Dr. GRO-D

HISTORY: Mr Gordon-Smith who is known to have a baseline Factor VIII 9% and has acquired the hepatitis C virus was electively admitted for endoscopy and laparoscopic inspection of the liver who previously had known anti-human and anti-porcine Factor VIII inhibitors.

EXAMINATION: He was very well. General examination was unremarkable.

INVESTIGATIONS: Haemoglobin 148, white cell count 8.4, platelets 201, APTT 66 seconds, control 34 seconds, ALT 75, liver function tests otherwise were normal.

MANAGEMENT AND PROGRESS: He was given 2100 units of Factor VIII. The day before his procedure giving a post-dose level of 61%. Again on the day of his endoscopy he had a further 1000 units before the procedure.

Endoscopy was normal and this was followed by laparoscopy which showed chronic hepatic changes. A biopsy was not taken. He was given a further 1500 units of Factor VIII same night and bd for the next 36 hours and he was well enough to be discharged home on the 6th May taking 1000 units daily for a further 2 days.

MEDICATIONS ON DISCHARGE: Factor VIII as outlined above. No regular medications.

FOLLOW-UP: An appointment will be made for him to attend the Joint Liver and Haemophilia Clinic and for his sutures to be removed.

INFORMATION TO PATIENT: It was explained to Mr Gordon-Smith that his endoscopy was normal and his laparoscopic inspection and liver suggest mild chronic changes. A trial of Interferon therapy will be considered as an outpatient.
