GRO-C

This 64-year-old gentleman with von Willebrand's disease and chronic infection with hepatitis C was admitted on the 19th July with pain over his right hypochondrial region. On examination the liver was hugely enlarged and nodular and very tender. An alpha-fetoprotein done at that time showed that it was very raised at 93.913 kU/L, the normal limits being less than 11.3. An MRI scan of his liver also shows that he has diffuse right lobe hepatocellular carcinoma with portal vein invasion.

This patient has cirrhosis due to chronic hepatitis C infection as well as drinking alcohol quite heavily for several years. He was last seen in the Liver Clinic in February of this year when a lipiodol angiogram did not show any evidence of increased uptake in his liver. There has been rapid progression of his hepatocellular carcinoma within the past few months as you can see. Currently, as his haemoglobin is low we are giving him some blood transfusions and a chest x-ray will be done to rule out any pulmonary metastases. We have also liaised with the Palliative Medical team for care of this patient who is in the terminal phase of his underlying hepatocellular carcinoma.

Yours sincerely

GRO-C

Dr Thynn Thynn Yee
Associate Specialist in Haemophilia

Gray's Inn Road was the site of the old Royal Free Hospital which, with other Royal Free sites, was replaced in 1974 by the hospital in Pond Street. It is commemorated in the name of the division which includes medicine, accident and emergency services, cancer treatment, haematology and services for elderly people, together with pathology and radiology.
