12th June, 1985.

Dear Peter,

As we discussed previously on the phone, I have just treated two virgin haemophiliacs with alpha heat treated FVIII. The details of the two patients are as follows:

**GRO-A**

FVIIIIC - 0.12 iu/ml

This young man who works around the corner from the Middlesex Hospital fell off his bike and was infused with 7,800 units of alpha heat treated Factor VIII over the course of four days, starting on May 13th. He had never before received any blood products. He has agreed to be followed up at fortnightly intervals for the next year.

Luke O'SHEA-PHILLIPS dob **GRO-C** 81  
FVIIIIC - 0.20 iu/ml

This young boy fell over and hit his mouth and upper teeth on the ground and when I first saw him they had been intermittently bleeding for 3 days. As an infusion of DDAVP had not controlled the bleeding he then received 1,680 units of alpha heat treated FVIII concentrate. This boy also was a virgin and had never received any blood products in his life.

Both patients received Profilate List Number 360210, Lot Number A6-0311. Both patients will attend for fortnightly follow-up blood samples, for liver function tests, blood count and virology. I hope they will be suitable for the heat treated trial.

With best wishes,

Samuel J. Machin  
Consultant Haematologist
